Talkstamp: App Review Guide

Version 0.1.0 (build 2) for iPhone and iPad, iOS 17 or later. No account or sign-in is needed. This guide explains what the app does, how to test every feature in a few minutes without speaking, and how it differs from other invoice apps.

1. What Talkstamp is

Talkstamp is for small shops and counters that issue invoices all day. The user says (or types) what was sold, for example "two shirts at 20 each and a pair of pants for 40". The app turns that sentence into invoice line items, the user checks them, and Talkstamp produces a PDF that carries the company logo, **real company stamp** and **signature**, ready to share by WhatsApp, Mail, Messages, AirDrop or Files.

It is original software written from scratch in SwiftUI. It does not use a template, a white-label kit, or code from our other apps, and it is unrelated to them.

2. Test it in 3 minutes (no microphone needed)

1. Open the app. On the **Invoices** tab tap the round microphone button at the bottom right.
2. Tap the "What I heard" box and type: *Two shirts at 20 each and a pair of pants for 40*
3. Tap **Done**, then **Use these items**. The editor opens with two lines filled in: shirts, quantity 2, price 20; pair of pants, quantity 1, price 40. Anything the parser is unsure about is flagged for the user to fix.
4. Enter a customer name and tap **Save**. Open the invoice to see the PDF preview and the share sheet.
5. Open the **Shop** tab to add a logo, import a stamp photo from Photos (the live camera scan needs a real device), and draw a signature with a finger. Create another invoice to see the stamp and signature on the PDF.

3. Sample sentences in all five languages

Type any of these into the "What I heard" box, with the matching language chosen on the dictation screen. Each one is covered by an automated test in our repository, so the result shown is what the app produces.

Language	Sentence	Result
English	Put in two shirts at 20 bucks each and also a pair of pants for 40	shirts, 2 x 20; pair of pants, 1 x 40
English	a jacket for one hundred and fifty dollars	jacket, 1 x 150
English	three coffees for 12 dollars in total	coffees, 3 x 4 (total split by quantity)
Français	deux chemises à vingt euros chacune et un pantalon pour quarante euros	chemises, 2 x 20; pantalon, 1 x 40
Français	un sac à quatre-vingt-dix euros	sac, 1 x 90
Español	dos camisas a veinte euros cada una y unos pantalones por cuarenta euros	camisas, 2 x 20; pantalones, 1 x 40
Español	un bolso a treinta y cinco euros	bolso, 1 x 35
Italiano	due camicie a venti euro l'uno e un paio di pantaloni a quaranta euro	camicie, 2 x 20; paio di pantaloni, 1 x 40
Italiano	un orologio a duecentocinquanta euro	orologio, 1 x 250
中文	两件衬衫每件二十块，一条裤子四十块	衬衫 2 x 20; 裤子 1 x 40

The parser is our own rule-based engine for spoken numbers (for example "quatre-vingt-dix", "treinta y cinco", "duecentocinquanta"). It runs on the device and sends nothing anywhere.

4. How Talkstamp is different from other invoice apps

1. **The stamp is part of the product.** In many countries an invoice is not valid without the company stamp and signature. Talkstamp turns a photo of the user's real stamp into a transparent image (it removes the paper and keeps only the ink) and places it with the signature on every PDF. Check: Shop tab, then the bottom of any invoice PDF.
2. **Built for a counter with several staff.** Up to three voice profiles let the app tell who is speaking, and counter mode keeps the screen listening for the phrase "New invoice" so a busy seller can start an

invoice hands-free. Voiceprints are numeric, never recordings, and need the person's consent. Check: Shop tab, Team and voices; the radio-waves button at the top left of Invoices.

3. **Five languages in the parser, not only in the interface.** English, French, Spanish, Italian and Simplified Chinese number words and phrasing are understood. See section 3.
4. **Each invoice can be written in the customer's language,** independent of the phone language. Check: editor, Invoice language.
5. **Start without touching the phone:** Siri and Shortcuts, a Home Screen and Lock Screen widget, and a Control Center button open straight into dictation.

5. Purchase (no subscription)

The app is free for up to 5 invoices per month. **Talkstamp Pro** removes the limit with a single **one-time, non-consumable in-app purchase** (*cc.voiceinvoice.app.pro.lifetime*, $19.99). There is no subscription, no trial and nothing renews, which fits an app that runs entirely on the device. Invoices already created always stay free to view, export and share. The paywall shows the price, links to the Terms of Use and Privacy Policy, and has a Restore Purchases button. Check: create a sixth invoice in a month, or open the Shop tab, Plan.

6. Privacy and permissions

- We run no servers and the app contains no analytics, advertising or tracking code. Nothing is collected by us (App Privacy: Data Not Collected).
- **Microphone and Speech Recognition:** used only while the user dictates or runs counter mode. Apple's Speech framework is used, on the device when the language supports it; the screen shows which mode is active. Recordings are never stored.
- **Camera:** only to scan the company stamp. **Photos:** only if the user imports a stamp or logo.
- Invoices and the shop profile are stored on the device and, when the user is signed in to iCloud, in the user's own private iCloud database.

7. Screens

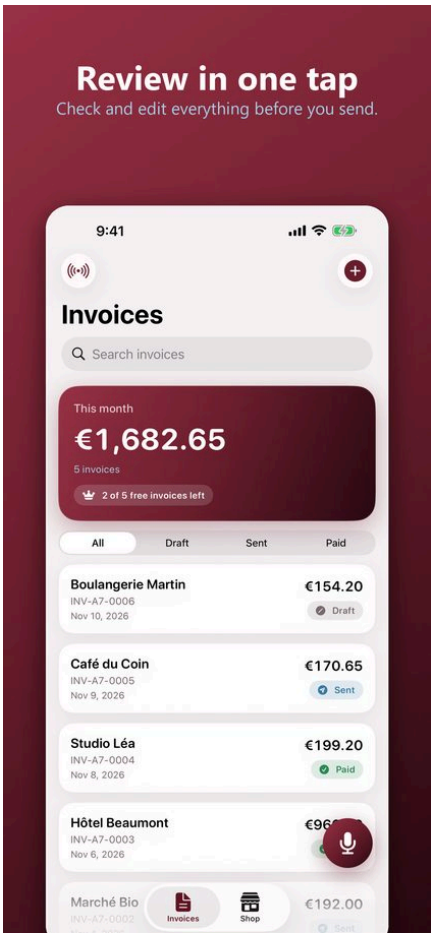

Seven screens from the app are on the following pages.

Contact details for the review team are in App Review Information.

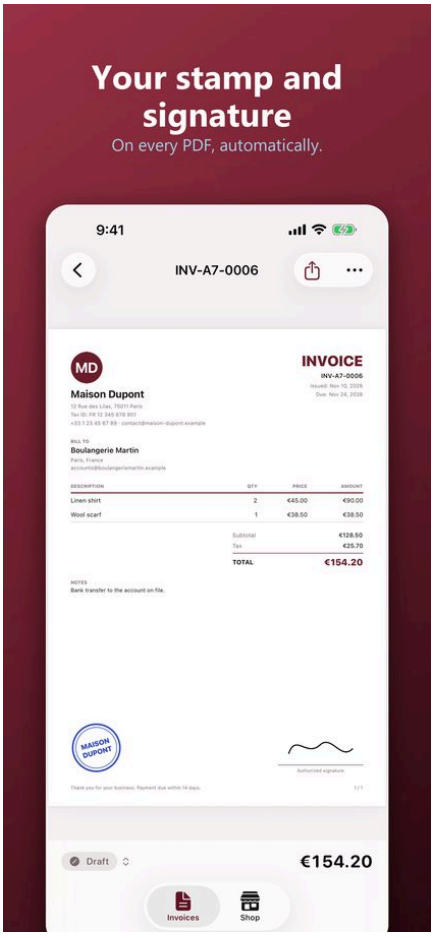

Screens from Talkstamp

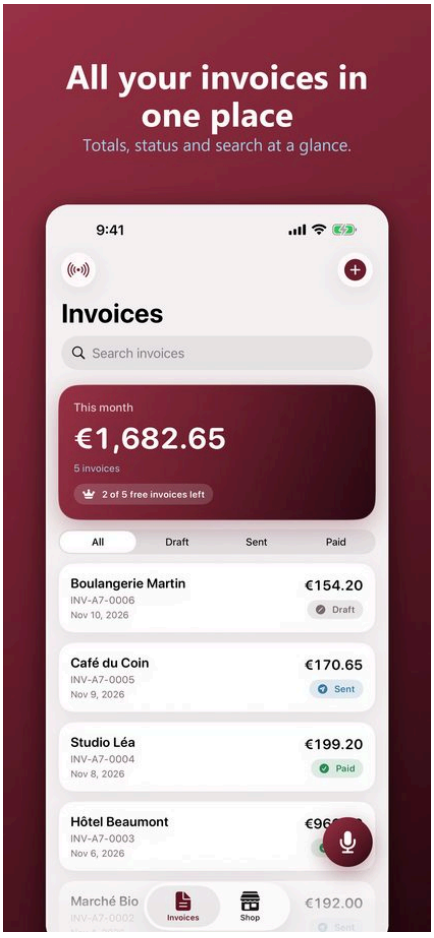

Dictation: say or type the items; the heard text stays editable

Editor: parsed line items, customer, tax, discount, due date

Finished PDF: company stamp and signature on the invoice

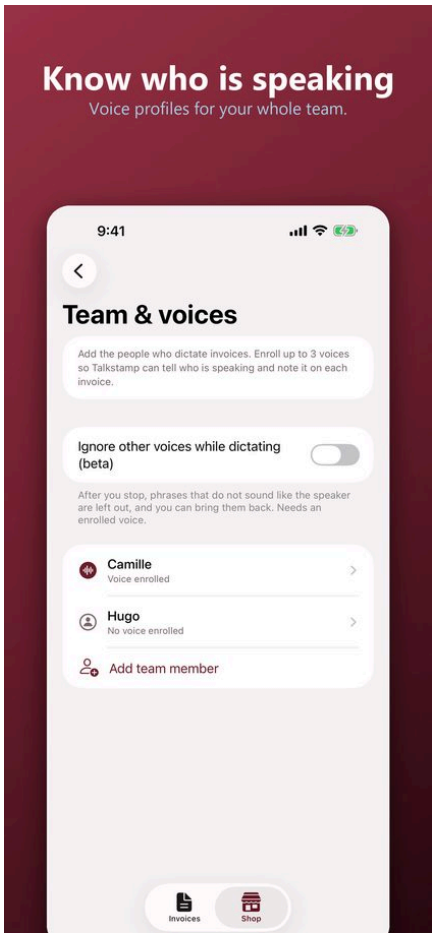

Invoices list with status filter and monthly total

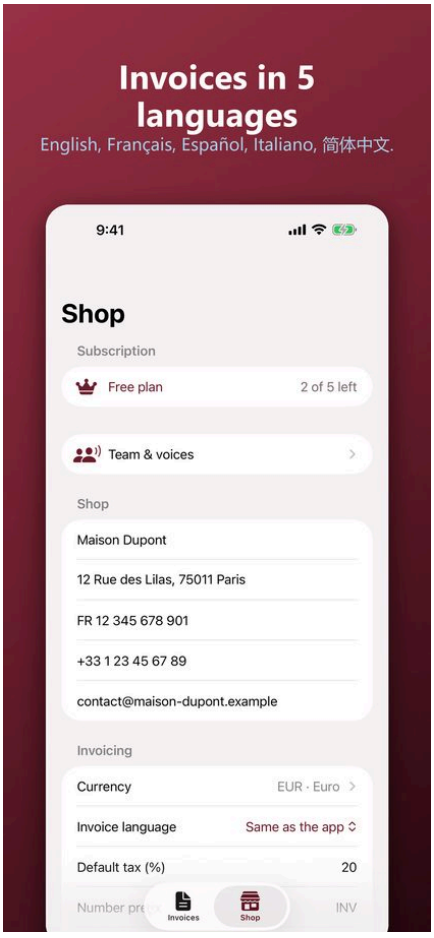

Screens from Talkstamp (continued)

Counter mode: waits for the phrase 'New invoice'

Team and voices: optional voice profiles (consent screen)

Shop profile: logo, stamp, signature, currency, language
